CSIT110

Fundamental Programming with Python

If-else

Goh X. Y.

In this lecture

- Indentation
- If-else
- If-elif-else
- Logical operators

Indentation

In Python, all the continuous lines indented with same number of spaces form a **block**.

All statements within the block **must be indented the same amount**.

We usually use 2, 3 or 4 spaces for indentation.

Indentation

```
code
code
keyword_a statement_x:
····code                # 1 level of indentation
····code                # 1 level of indentation
····keyword_b statement_y:
········code            # 2 levels of indentation
········code            # 2 levels of indentation
········code            # 2 levels of indentation
····code                # 1 level of indentation
code                    # 0 level of indentation
```

Legend
· is a whitespace

Indentation

```
code
code
keyword_a statement_x:
··code                  # 1 level of indentation
··code                  # 1 level of indentation
··keyword_b statement_y:
····code                # 2 levels of indentation
····code                # 2 levels of indentation
····code                # 2 levels of indentation
··code                  # 1 level of indentation
code                    # 0 level of indentation
```

Legend

Indentation

```
code
code
keyword_a statement_x:
-code                    # 1 level of indentation
-code                    # 1 level of indentation
-keyword_b statement_y:
--code                   # 2 levels of indentation
--code                   # 2 levels of indentation
--code                   # 2 levels of indentation
-code                    # 1 level of indentation
code                     # 0 level of indentation
```

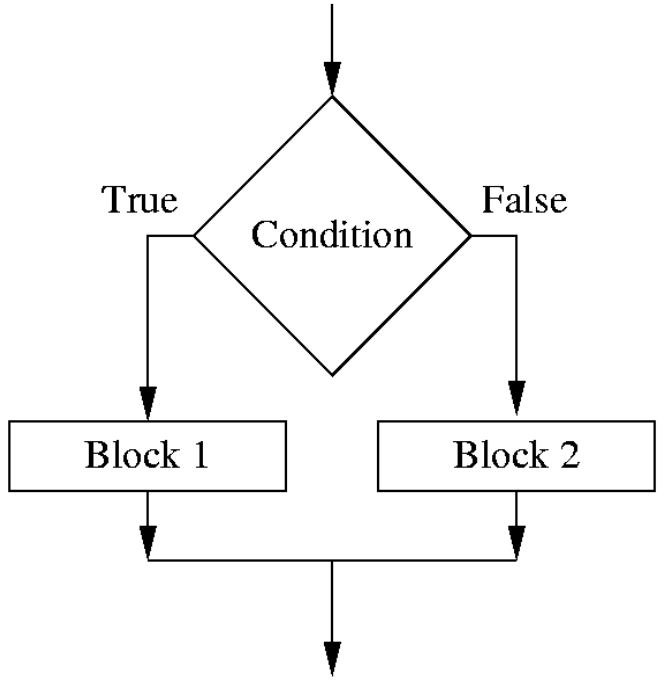
Legend
– is a Tab

if - else

How does it look like?

```
if some condition:
    # block statements if condition
    # is True

else:
    # block statements if condition
    # is False
```



Syntax

```
if some condition:
··this is
··a block
··of codes
··that is indented
··by the same amount
··of spaces
else:
··usually
··we use 2, 3 or 4 spaces for
··indentation
```

1. if
2. condition
3. colon :
4. indentation

Syntax

```
if some condition:
··this is
··a block
··of codes
··that is indented
··by the same amount
··of spaces
else:
··usually
··we use 2, 3 or 4 spaces for
··indentation
```

1. if
2. condition
3. colon :
4. indentation

In Python, all the continuous lines indented with same number of spaces form a **block**.

All statements within the block **must be indented the same amount**.

We usually use 2, 3 or 4 spaces for indentation.

Common Mistakes

Forget the colon **:**

```
if some condition:
    this is
    a block
    of codes
    that is indented
    by the same amount
    of spaces
else:
    usually
    we use 2, 3 or 4 spaces for
    indentation
```

What happens when there is no indent:

```
    ^
IndentationError: expected an indented block
>
```

Wrong indentation,
mix-up between spaces and tabs
mix-up number of spaces

Make your choice of indentation and use it consistently!

If - else – Example 1

Number of items	Cost
1-50	$3 per item Postage: $10
More than 50	$2 per item Postage: free

If - else – Example 1

Number of items	Cost
1-50	$3 per item Postage: $10
More than 50	$2 per item Postage: free

If the user buys 10 items:

```
Item cost = $3 x 10 = $30
Postage: $10

Total cost: $40
```

If - else – Example 1

Number of items	Cost
1-50	$3 per item Postage: $10
More than 50	$2 per item Postage: free

If the user buys 100 items:

```
Item cost = $2 x 100 = $200
Postage: free

Total cost: $200
```

If - else – Example 1

```
# get the number of items from the user

# calculate the cost
```

If - else – Example 1

```
# get the number of items from the user

item_input = input("Enter the quantity: ")
item_count = int(item_input)

# calculate the cost

if item_count <= 50:
    
    
else:
    
    
```

If - else – Example 1

```
# get the number of items from the user

item_input = input("Enter the quantity: ")
item_count = int(item_input)

# calculate the cost

if item_count <= 50:
    unit_price = 3
    postage = 10
    total_cost = unit_price * item_count + postage
    print(f"Total cost: ${total_cost}")
else:

```

If - else – Example 1

```
# get the number of items from the user

item_input = input("Enter the quantity: ")
item_count = int(item_input)

# calculate the cost

if item_count <= 50:
    unit_price = 3
    postage = 10
    total_cost = unit_price * item_count + postage
    print(f"Total cost: ${total_cost}")
else:
    unit_price = 2
    total_cost = unit_price * item_count

    print(f"Total cost: ${total_cost}")
```

if - elif - elif - … - else

if - elif - elif - … - else

```
if condition1:
    # condition1 is true
    statement
    statement
    ...
elif condition2:
    # condition1 is false and condition2 is true
    statement
    statement
    ...
elif condition3:
    # condition1 is false, condition2 is false, and condition3 is true
    statement
    statement
    ...
else:
    # all the conditions are false
    statement
    statement
    ...
```

Example 2

Number of items	Cost
1-50	$3 per item Postage: Standard post: $10 Registered post: $15 Express post: $20
More than 50	$2 per item Postage: Standard post: free Registered post: $15 Express post: $20

10 items + Registered Post

```
Item cost = $3 x 10 = $30
Postage: $15
Total cost: $45
```

Example 2

Number of items	Cost
1-50	$3 per item Postage: Standard post: $10 Registered post: $15 Express post: $20
More than 50	$2 per item Postage: Standard post: free Registered post: $15 Express post: $20

100 items + Registered Post

```
Item cost = $2 x 100 = $200
Postage: $15
Total cost: $215
```

Example 2

Number of items	Cost
1-50	$3 per item Postage: Standard post: $10 Registered post: $15 Express post: $20
More than 50	$2 per item Postage: Standard post: free Registered post: $15 Express post: $20

100 items + Standard Post

```
Item cost = $2 x 100 = $200
Postage: free
Total cost: $200
```

Example 2

```
# get the number of items from the user

# get the shipping method Standard/Registered/Express?

# calculate the cost
```

Example 2

```
# get the number of items from the user
item_input = input("Enter the quantity: ")
item_count = int(item_input)

# get the shipping method Standard/Registered/Express?
shipping = input("Shipping method (s/r/e): ")

# calculate the cost
```

Example 2

```
## calculate the cost

# determine the unit price

# determine the postage

# determine the total cost

```

Example 2

```
# determine the unit price

if item_count <= 50:
    unit_price = 3

else:
    unit_price = 2
```

Example 2

```
# determine the postage
if shipping == "s":
    # standard
elif shipping == "r":
    # registered post $15
    postage = 15
else:
    # express post $20
    postage = 20
```

Example 2

```
# determine the postage
if shipping == "s":
    # standard post $10 for 1-50 items, free for > 50 items
    if (item_count <= 50):
        postage = 10
    else:
        postage = 0

elif shipping == "r":
    # registered post $15
    postage = 15
else:
    # express post $20
    postage = 20
```

Example 2

```
# determine the postage
if shipping.lower() == "s":
    # standard post $10 for 1-50 items, free for > 50 items
    if (item_count <= 50):
        postage = 10
    else:
        postage = 0

elif shipping.lower() == "r":
    # registered post $15
    postage = 15
else:
    # express post $20
    postage = 20
```

Example 2

```
# determine the postage
if shipping.lower() == "s":
    # standard post $10 for 1-50 items, free for > 50 items
    if (item_count <= 50):
        postage = 10
    else:
        postage = 0

elif shipping.lower() == "r":
    # registered post $15
    postage = 15
else:
    # express post $20
    postage = 20
```

Example 2

```
# determine the total cost

total_cost = unit_price * item_count + postage

print(f"Total cost: ${total_cost}")
```

Example 2 all together

```
# Get number of items from user
item_input = input("Enter the quantity: ")
item_count = int(item_input)

# Get shipping method - Standard/Registered/Express?
shipping = input("Shipping method (s/r/e): ")

# Determine unit price
if (item_count <= 50):
    unit_price = 3
else:
    unit_price = 2

# Determine postage
if shipping.lower() == "s":
    # standard post $10 for 1-50 items, free for > 50 items
    if (item_count <= 50):
        postage = 10
    else:
        postage = 0
elif shipping.lower() == "r":   # registered post $15
    postage = 15
else:                           # express post $20
    postage = 20

# calculate total cost
total_cost = unit_price * item_count + postage
print(f"Total cost: ${total_cost}")
```

Example 3

```
# grade A: 100-80, B: 79-60, C: 59-40, D: 39-0

# ask user to enter the mark

# determine the grade based on mark

# display the mark and grade
```

Example 3

```
# grade A: 100-80, B: 79-60, C: 59-40, D: 39-0

# ask user to enter the mark

mark_input = input("Please enter mark: ")
mark = int(mark_input)

# determine the grade based on mark

# display the mark and grade
```

Example 3

```
# grade A: 100-80, B: 79-60, C: 59-40, D: 39-0

# determine the grade based on mark

if mark >= 80:
    grade = "A"
elif mark >= 60:
    grade = "B"
elif mark >= 40:
    grade = "C"
else:
    grade = "D"
```

Example 3

```
# display the mark and grade

print(f"Mark {mark}, Grade {grade}")
```

Example 3

```
# grade A: 100-80, B: 79-60, C: 59-40, D: 39-0

mark_input = input("Please enter mark: ")
mark = int(mark_input)
if mark >= 80:
    grade = "A"
elif mark >= 60:
    grade = "B"
elif mark >= 40:
    grade = "C"
else:
    grade = "D"
print(f"Mark {mark}, Grade {grade}")
```

mark is greater than or equal to 80

```
Please enter mark: 90
Mark 90, Grade A
```

Example 3

```
# grade A: 100-80, B: 79-60, C: 59-40, D: 39-0

mark_input = input("Please enter mark: ")
mark = int(mark_input)
if mark >= 80):

  File "<stdin>", line 1, in <module>
NameError: name 'x' is not defined
```

Operators for comparisons

Equality

Remember the double equal sign ==

```
if number1 == 5:
    # number1 is equal to 5
if number1 == number2:
    # number1 is equal to number2
if your_answer == "Y":
    # your_answer is equal to "Y"
if student_name == "John":
    # student_name is equal to "John"
```

Inequality

```
if number1 != 5:
    # number1 is not equal to 5
if number1 != number2:
    # number1 is not equal to number2
if your_answer != "Y":
    # your_answer is not equal to "Y"
if student_name != "John":
    # student_name is not equal to "John"
```

Comparison

```
if number1 < 5:
    # number1 is less than 5
if number1 <= 5:
    # number1 is less than or equal to 5
if number1 > 5:
    # number1 is greater than 5
if number1 >= 5:
    # number1 is greater than or equal to 5
```

Logical AND

```
if number1 > 5 and number1 < 10:
    # number1 is greater than 5 AND less than 10
if ((age > 40) and (student_type == "Domestic")):
    # age is greater than 40 # AND student_type is equal
    to "Domestic"
```

Logical OR

```
if (number1 < 1000) or (number1 > 5000):
    # number1 is less than 1000 # OR greater than 5000
if ((student_type == "Exchange"):
    or (student_type == "Domestic")):
    # student_type is equal to "Exchange" # OR is equal to "Domestic"
```

Logical Negation

```
if (not (number1 == 1000)):
    # number1 is not equal to 1000
```

Operator (other languages)	Operator (Python)
&&	and
||	or
!	not

Problem solving example

A shop sells a product item for $10, but makes a discount that 3 items only cost $20. Write a program to ask the user to enter the number of items they want to buy. Then the program displays the cost.

How much does it cost for 7 items?

How much does it cost for 12 items?

How much does it cost for 14 items?

Any questions?
